| 1-60-5008 | Console, Message Video/Audio Only, Bogen AMP, PA Ready | \$ 3199.00 |

The Go-kart Track Control Panel is a state of the art timing and message delivery system that allows your attendants to maximize your returns while making certain that all of your customers have a safe ride.

Standard features include: Event Timing System, Digital Message Announcer with both audio and video playback capability, Local PA Amp with a Hand Held Microphone, Audible Attendant Alert at the end of the ride, Interfaces with track lights, speakers and most wireless systems for total track control.

Some models have the capability to house your Kartrol EXE shut down system. This heavy duty panel protects your investment. Housings are NEMA 4 Type and suitable for all weather use.

How does it work:

When the session is coming to an end the traffic control circuit will flash the yellow lights to alert the drivers and an audible tone will go off to alert the attendants. After a few seconds the traffic control circuit will switch the traffic lights to red and flash until the next session is begun. All times are individually adjustable to suit your needs. Automating the traffic lights is not all the Control Console will do for you! Depending on which version you choose it plays a automated pre ride brief message each time the attendant depresses the heavy duty toggle or it can be set to loop over and over. The generic message comes with the unit or make your own custom message for an additional cost. Hook up a few television monitors to the new "flash" model and you can add a professionally produced visual pre ride brief. Additional announcements can be made by using the heavy duty microphone. The units are made to be outdoor year round in their heavy duty enclosure. The only requirement for installation are to mount the Control Console, connect a 120v 20 Amp dedicated circuit, and to connect the traffic lights and system speakers. (traffic lights and speakers sold separately) Call J&J Amusements to discuss the model and options and pricing of the Control Systems

The Control Console is a state of the art Kart systems control panel featuring a traffic control circuit that allows automatic timing of the kart ride. The traffic control circuit will allow you to hook up as many as 5 traffic lights. The attendant starts each session by depressing the green heavy duty go button. The traffic control circuit changes the traffic lights to green and accurately times the ride to the preset time. If you need to slow the session the attendant depresses the heavy duty yellow button. The traffic lights go to yellow until the green button is pressed. The time continues to time the ride to keep each session exactly the same duration.
